Creo® Piping and Cabling Extension

## ACCELERATE YOUR PIPING AND CABLING DESIGN PROCESS

Traditional mechanical products are becoming more and more complex due to their increased reliance on electrical and hydraulic technology. Control systems are also advancing at an astonishing rate, forcing product designers to pay much more attention to electrical and fluid requirements.

As designers move to take advantage of the IoT and sensors are added, the requirements for piping and cabling increase. All of this means that designers are now dealing with more complicated piping and cabling routings, which traditionally have taken alow priority during product design.

To be successful, designers must make electrical and fluid design a higher priority and a more integral part of the detailed design process. Yet as product complexity increases and schedules continue to shrink, where will you find the time and tools to design these increasingly complex routings?

Creo Piping and Cabling Extension (PCX) is the perfect 3D solution because it supports all types of industries and styles of piping and cabling, so you can streamline and accelerate the entire design process. Whether you're designing products with a complex web of cables and harnesses, hydraulic or pneumatic hoses, high and low pressure tubing, copper work, or even large bore pipes, Creo PCX can handle the job, no matter how intricate.

Key Benefits

- Capture and document schematic information and manufacturing documentation

- Minimize errors and reduce time-consuming tasks by automating the capture of all relevant system information, such as the schematic design, virtual prototype, or manufacturing documentation

- Fully automate your routing so you can quickly determine the optimum path for manufacturing, cost, and serviceability

- Ensure design rules and schematic logic rules are enforced through specification-driven design

- Increase design speed through the reuse of standard symbols, connectors, and fittings contained in a customizable library

- Reduce costs and design time by eliminating the need for physical prototypes, made possible through virtual interference checking and automated manufacturability verification

- Enable cost-effective manufacturing through accurate documentation, such as isometric drawings, bend tables, and BOMs
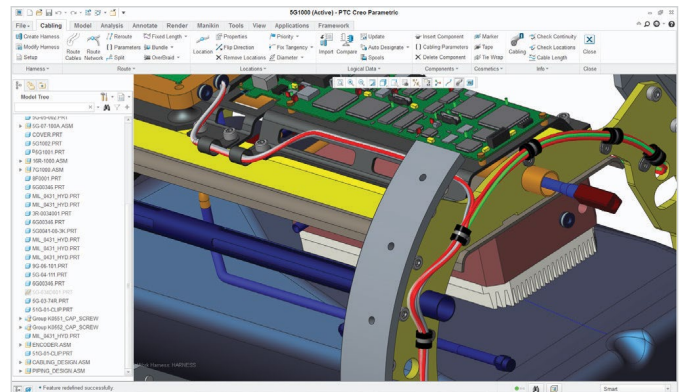

Automated cabling design capabilities make it easy to move components and connectors without manually rerouting wires and cables.
Accelerate 3D Routed Systems Design

A time-consuming, error-prone process

Determining the routes of pipes and cables can be a difficult, time-consuming task. Beginning with the creation of a physical prototype and then manually routing the pipes through it, this long, tedious process is typically error-prone. Because of the time and effort involved, the engineer often must accept the first route that works — not necessarily the optimal one.

Even worse, when an engineering change is made to the design, it means the engineer must start over by recreating the physical prototype and rerouting the cabling or piping — thus wasting valuable time. Additionally, most companies that create the cabling

With Creo PCX, you can immediately determine the best piping routes between even the most complex systems.

prototypes don't document the cabling routes, which make it difficult to service these products.

To solve these issues, a company will often send a service engineer to the field, which can be very costly. With Creo PCX, these problems can be avoided.
Creo Harness Manufacturing Extension (HMX)

Creo HMX dramatically reduces the time to create documentation and the user expertise required to create standardized manufacturing documentation. At a touch of a button and at any stage of the design process, manufacturing documentation can becreated for purchasing to obtain the most competitive manufacturing cost.

Key benefits:

- The intuitive, easy-to-use user interface enables any engineer to create manufacturing documentation to a pre-defined standard
- New streamlined solution improves user efficiency and productivity
- Easily accommodate late-stage changes to your engineering design faster and with less frustration
- Documentation is automatically created to a preconfigured standard
- 3D retention is essential for associative drawing to the 3D model within a fully iterative design process

Creo Schematics™

Creo Schematics provides all the capabilities that designers of piping and cabling systems need to easily capture the logical connectivity information in 2D schematics. Included with Creo PCX, Creo Schematics is an introductory schematic tool that can grow with your design needs. Advanced

Creo Harness Manufacturing Extension (HMX).

capabilities, such as design reuse support, multiuser capabilities, customization for design automation, and central catalog, can be added optionally.

Capabilities and specifications

- Piping diagrams
    - Supports 2D pneumatic, hydraulic, process
- Cabling diagrams
    - Supports 2D Block Interconnect, Circuit, and Wiring Interconnect design
- Design reuse
    - Central Design Catalog
    - Data tables
    - Import legacy Pro/DIAGRAM data
- Electrical simulation
    - Seamless integration to E-Simulate
    - E-Simulate Lite is available only with the full version free of charge
- - E-simulate standard can be purchased from www.virtual-interconnect.co.uk
- Windchill integration
    - Developed through www.virtual-interconnect.co.uk
- Design reuse
    - Drives Creo 3D piping and cabling designs
    - Drives other 3D CAD routed systems designs

Piping Design

Creo PCX enables designers to fully automate the pipe-routing process. Designers no longer have to build physical prototypes and struggle through the trial-and-error process; they can determine — virtually — the optimal paths of the pipes in the model. In addition, designers can create rules that are based on company best practices or corporate

policies. By establishing rules, the software can then verify that this optimal path is compliant with established manufacturing rules. Plus, designers have access to a library of standard fittings, which can be reused from product to product, reducing time-to-market and increasing designer productivity.

The fully associative nature of Creo Parametric™ ensures that the pipe routing — and accompanying documentation — will automatically update whenever a design change is made to the model.

Accurate and efficient routing of pipelines and fittings:

- Automate the creation of 3D routes from 2D schematics

- Leverage intelligent schematic information for design reuse

- Create piping routes faster using lightweight representations

- Automate fitting placement based on schematic information while adhering to design rules

- Concurrently route pipelines in a multi-user environment

- Asynchronous piping settings let you change the pipe shape, bend radius, corner type, or line stock on the fly

- Manipulate existing pipelines easily with an intuitive dashboard user interface, shortcut menus, and dynamic dragging

Comprehensive suite of tools for fitting insertion:

- Search for fittings that meet the specifications of your project so you only work with the correct pipes and fittings

- Automatically display the correct fittings based on schematic information

- Automate the placement of gaskets, flanges, elbows, and other components

- Preview the placement of the object to achieve full control over the insertion

Reinforce predefined rules through violation detection:

- Maximums and minimums of the bend radius

- Minimum branch separation and branch angle

- Placement and missing fittings

- Flow violations

Complete control over flow directions:

- Automatically set initial flow direction based on routing

- Easily change flow direction for a series or pipeline

- Automatically reverse directional fittings with change of flow direction

**Verification of piping routes to prevent errors:**

- Electronically verify 3D data — compared to logical data — to detect missing fittings and other common missteps

- Check for design rules, such as missing gaskets, in the model

- Create automatic cut lists, bend tables, and BOMs

Easily extract information from the design for outputs:

- Bill-of-Materials

- Bend machine and detailed fitting reports available

- Schematic consistency check

- Communication of piping system layout and detail in the form of isometric, installation, and pipe spool drawing

- Output to CNC bending machines

Cabling Design

Creo PCX gives you the power to extract logical information from 2D schematics while automating your 3D cable routing. Not only can you determine a working route quickly, but you can easily find the optimal route that won't interfere with the design. Plus, since it's a Creo Parametric model, it has the advantage of full associativity; that means any change made to the model is automatically reflected in the cabling routes. With fewer (if any) physical prototypes and shorter design cycles, you'll save significant time and money.
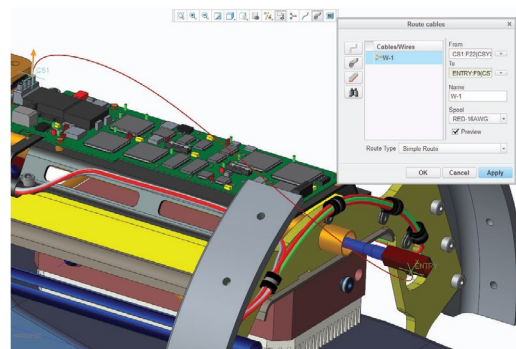

Determine the connections either manually or from logical information. Creo PCX automatically generates a simple path which then enables the user to find the optimum path faster.

Automated cable routing referencing 2D schematic logic

- Designate components, determine cable connections, and auto-route cables

Visually inspect and optimize routings for cost, manufacturing, and serviceability

- Easily optimize cable routes using shortcut menus and dynamic dragging
- Associative updates to cable routes using shortcut menus and dynamic dragging

Automatic verification of cable routing referencing schematic logic

- Verify wires and from-to pin connections referencing 2D logic

Create accurate harness manufacturing documentation

- Manual creation using harness manufacturing capabilities including with Creo PCX
- Automatic creation using Creo HMX

Language support

- English, German, French, Italian, Spanish, Japanese, Chinese (Simplified and Traditional), Korean, and Russian.
- Creo Schematics Lite is available in English, French, German, Japanese, and Simplified Chinese

Platform support and system requirements

⟫⟫ THE CREO ADVANTAGE:

Creo is the 3D CAD solution that helps you accelerate product innovation to build better products faster. Easy-to-learn Creo uses a model-based approach to seamlessly take you from the earliest phases of product design to manufacturing and beyond. Combining powerful, proven functionality with new technologies including generative design, real-time simulation, advanced manufacturing, IIoT and augmented reality, Creo helps you iterate faster, reduce costs and improve product quality. Creo is also available as a SaaS product, providing innovative cloud-based tools for real-time collaboration and streamlined license management and deployment. The world of product development moves quickly, and only Creo delivers the transformative tools you need to build competitive advantage and gain market share.
